01 October 2014

NewerTech starts shipping the Wireless Aluminium Keypad-- a numeric keypad companion to Apple-style keyboards featuring precision machined aluminium housing, white keys and a bracket for tool-free attachment to keyboards.

Designed for use with number-intensive programs, as well as any software with extensive shortcut use, the keypad is a full-size 28-key number with delete, tab and navigation keys, as well all the other buttons a numeric keypad demands.

It connects wirelessly to PCs via Bluetooth, and promises "just right" feel, design, size and connectivity for what the company describes as "maximum number crunching workflow excellence."

"We made it our mission to create a reliable wireless keypad that's built to the highest standards and functions the way we expect numeric keypads to work, and complements the wireless keyboards offered by Apple," NewerTech says. "That day has finally arrived and now professionals have a high-quality wireless keypad to enhance their number crunching workflows."
