

A Backpack's Worth of Backup Power

Written by Marco Attard

If there's one worry afflicting most, if not all, long distance travelers, it's the charging of all of one's mobile devices. AMPL Lab claims to banish such travel woes with the battery-laden AMPL SmartBackpack.

The concept behind the SmartBackpack is simple enough. As the name suggests it is a backpack carrying what AMPL describes as "the world's most advanced portable charging system"-- namely a modular 15000mAh "SmartBattery" (accommodates up to 3 additional "SmartBoost" modules for up to 147Wh of power) and 6 USB ports for the charging of multiple smartphones, tablets and even a laptop.

AMPL also promises fast battery charging via Qnovo technology, as well as easy battery management via companion mobile device app. Meanwhile the actual backpack features 7 storage compartments and is shock-proof and water-resistant.

The AMPL SmartBackpack is currently available on preorder basis on Indiegogo, with shipments set to kickoff from September 2015.
