---

GoPro presents a miniature, voice-activated means for the remote control of its latest titular cameras-- the Remo, a device providing controls for a number of commonly used commands.

The device is small enough to clip on clothing or collars, and like other GoPro cameras it is waterproof. It is compatible with voice-activated GoPro offerings (namely the Hero5 Black and Hero5 Session) and features "easy-to-remember" commands to start-and-stop recording, snap photos, switch between capture modes, set a highlight tag and switch the camera off.

The Remo handles 10 different languages, has a 10m range and promises to be able to hear users even in windy and noisy environments. It should be available in time for the holiday shopping season complete with both clip and wrist housings.
