

More GAMING Peripherals from MSI

Written by Frederick Douglas
08 November 2018

MSI announces a pair of PC gaming peripherals making part of the GAMING portfolio-- the Clutch GM50 GAMING mouse and Vigor GK60 GAMING keyboard, both promising "unique" features and exclusive Gaming Center software.

The GM50 mouse features an ergonomic and lightweight design ideal for rapid movement in FPS or action games. It is built around the PMW 3330 optical sensor with a max CPI of 7200, and Omron switches with a lifetime of over 20 million clicks. Being a piece of gaming hardware means it also feature LED lighting around the outside, and users can customise it through MSI RGB Mystic Light software.

Meanwhile the GK60 keyboard features a "solid and durable" aluminium frame holding Cherry MX Red switches with a low actuation force, allowing for rapid key presses. The keys also feature metal keycaps for a "recognisable tactile anchor," and last over 50 million keystrokes. A set of hotkeys allow for LED control without need for software, and one can also control the lighting via RGB Mystic Light software.

The two peripherals are compatible with Gaming Center-- a piece of MSI software providing detailed control over various settings. Both ship from November 2018.
