

Cooler Master Claims Lightest MM710 Mouse

Written by Alice Marshall
14 August 2019

According to Cooler Master, the MM710 is a "truly innovative mouse" promising to be the lightest in the world, thanks to a honeycomb shell construction allowing for a significant reduction in rodent mass.

First seen back at Computex 2019, the MM710 weighs 53g. The honeycomb design extends to the left and right sides and underside, as well as the top, and promises to be both durable and lightweight. Further reducing weight is an light low-friction "ultraweave" cable, while "superior" feet in PTFE material provide smooth control with a low friction glide.

The mouse is optimised for right-handed gaming, and features left and right buttons with Omron switches graded for 20 million clicks. It also includes a pair of extra buttons on the side. Inside is a "gaming-grade" PMW3389 optical sensor adjustable for up to 16000 DPI for greater precision and future-proofing.

The MM710 mouse is set to ship on September 2019.
