Logitech announces a pair of keyboard additions to the G gaming hardware range-- the wireless G915 Lightspeed and the wired G815 Lightsync, both featuring low-profile GL switches in a sleek aluminium case.

GL switches come in 3 variants, linear, tactile and clicky, or the equivalent of the Cherry MX Red, Brown and Blue switches. Logitech claims they are 50% the height of standard mechanical switches and offer 25% faster presses, making for a more comfortable typing experience.

The G915 features proprietary 2.4GHz wireless Lightspeed technology via companion dongle to pair with the PC. Bluetooth connectivity is also available. The company says battery life clocks at just 12 days if one has the RGB lighting on, but it shoots up to 135 days with the lighting off, as based on the assumption of 8 hours of use a day.

Customers wanting a wired keyboard get the G815 Lightsync, featuring the same style and finish as the G915 with x5 dedicated programmable G-keys, up to x3 on-board profiles and RGB lighting. The included USB cable connects the USB 2.0 passthrough port to an own input for 100% power throughput. Users can customise both G-keys and RGB lighting using G HUB software, and the lighting can synchronise with on-screen gaming and entertainment content.

The G915 and G815 keyboards are available from August 2019.
