

ZigBee Reaches Version 3.0

Written by Marco Attard
20 November 2014

The ZigBee Alliance unifies multiple ZigBee wireless networking technologies into a single standard-- ZigBee 3.0, a means enabling communications between multiple devices in both residential and enterprise applications.

ZigBee 3.0 is IEEE 802.15.4-based, operates at 2.4GHz and uses ZigBee PRO, the group's standard for network formation and the devices attached to them. However it lacks 2 ZigBee specs, namely Smart Energy 2.0 (an IP-based profile) and RF4CE (a ZigBee version geared at remote controls).

“Underneath the covers we are accommodating these multiple applications in a single standard, so ZigBee thermostats, for example, can be used in either home or office buildings,” the Alliance says.

However the ZigBee Alliance faces a crowded low-power networking market-- competing Internet of Things (IoT) standards include Qualcomm's AllJoyn technology and Nest's Thread Group, as well as familiar protocols such as Z-Wave, Bluetooth Low Energy and 6LoWPAN.

Either way ZigBee 3.0 is currently available in draft form for Alliance members, and should be ratified by Q4 2015.
