

D-Link Intros ULTRA Routers

Written by Marco Attard
08 January 2015

D-Link launches the ULTRA Performance series at CES 2015-- a trio of "aggressive" Stealth fighter-style 11AC wifi routers promising wireless speeds of up to 5.3Gbps, improved coverage and a revamped UI.

The routers (specifically the AC5300, AC3200 and AC3100) promise a range of advanced features, including Wireless 11AC Beamforming, automatic client assignment via Smart Connect and a QoS engine complete with drag-and-drop UI for simple prioritisation of applications and devices. Connectivity comes through high-power antennas (4 in the AC3100, 6 in the AC3200 and 8 in the AC5300), as well as gigabit ethernet ports.

Security comes through WPA, WPA2 and Wifi Protected setup. For further performance the AC5300 and AC3100 feature multi-user MIMO (MU-MIMO) technology enabling simultaneous transmission to groups of clients, making wifi networks more efficient and faster.

Also launched at CES 2015 by D-Link is the ULTRA AC1900 wifi USB adapter-- a USB 3.0 means for customers to add 802.11ac wifi capability to their older PCs and laptops.
