

BT Claims No More Black Spots With Smart Hub 6

Written by Marco Attard

BT promises to have a better wifi solution with the Smart Hub 6-- a router the company says is able to improve connections and boost speeds even in harder to reach rooms.

The Smart Hub 6 features 7 antennas, more than most routers supplied by UK broadband providers. A 3x3 array supports the 2.4GHz band, while the 5GHz band comes through a 4x4 array. The result is a signal range BT says reaching up to 500m, depending on obstacles around the home.

Further connectivity comes through x4 gigabit connectors and a USB port.

"Customers want a quality connection throughout their homes and the new BT Smart Hub delivers the UK's most powerful wi-fi signal so customers can enjoy wi-fi in more places," the provider says. "It's packed with the latest wi-fi technology and is the only router from a major UK broadband provider to offer 7 antennas to offer unbeatable wi-fi range."

The Smart Hub 6 is available now for select BT customers. It will also be on sale for non-BT subscribers.
