EnGenius Technologies announces the ESR530 smart router-- a product promising stable wifi in high-demand network environments as well as simplified configuration, remote cloud storage and recovery capabilities.

The ESR530 is designed to provide the strongest connections, even in the case of known wifi signal structural impediments. It offers Wave 2 speeds, and uses the most recent Qualcomm consumer technology to ensure seamless wireless coverage and connectivity. In addition, it turns into a free and secure private cloud storage solution by plugging an external HDD through the USB port.

Once setup with the companion EnMesh management app, users can log into the storage using a secure EnFile login on any mobile device. The EnMesh app also allows installers to create and manage robust networking solutions for smart homes, such as adding more routers to the system. In total the ES530 router supports up to 8 nodes in the same network, allowing a single wifi network to cover thousands of square feet of living space.

The ES530 is shipping now either separately or as a two-pack.
