G.Skill announces the Ripjaws family of DDR4 SO-DIMM memory kits designed specifically for small-form factor (SFF) platforms, including the fastest SO-DIMM memory kit from the company yet.

The memory kits ,along the range come in 4 specifications-- DDR4-3800MHz CL18-18-18-38 32GB (4x8GB), DDR4-3600MHz CL16-16-16-36 32GB (4x8GB), DDR4-3200MHz CL16-16-16-36 32GB (4x8GB), and DDR4-3200MHz CL16-16-16-36 64GB (4x16GB). All are based on the Samsung B-die DDR4 ICs, feature XMP 2.0 profiles and require 1.35V.

Interestingly, the company positions the memory kits for SFF PCs as opposed to notebooks-- probably due to the different memory sub-system topology usually found in laptops, demanding additional SPD tuning.

G.Skill says the Ripjaws DDR4 SO-DIMM kits will be available from partners in early December 2017.
