Ballistix Intros Tactical Tracer DDR4 Memory

Written by Frederick Douglas
 18 April 2018

Ballistix announces the Tactical Tracer RGB DDR4-- memory modules available in 8 or 16GB densities in graded kits offering speeds up to 3000 MT/s and capacity reaching 64GB.

The modules feature 16 RGB LEDs per module, as divided in 8 zones. To further add customisation, customers can remove the light bar and 3D print own designs. Other features from the Tactical series are present, such as XMP profiles, black PCB and custom heat spreaders.

Lighting control comes through the Ballistix MOD Utility software, which not only allows one to adjust LED colour schemes, brightness and display patterns, but also monitors memory temperatures in real time. In addition, the modules are compatible with LED-controlling software from other vendors, including Asus Aura, MSI Mystic Light and Gigabyte Aorus Graphics Engine.

The Tactical Tracer modules are available now to select Ballistix partners.
