Assistive technology specialist Tobii Dynavox announces what it claims is a world first-- the Indi, an all-in-one speech tablet for non-verbal communicators aimed at the consumer market.

The Indi is a Windows 10-based device. It carries outward-facing speakers with "exceptional loud and clear" output, while control comes through either touchscreen, switch or head mouse. Included Snap software promises intuitive symbol-based communication, making it ideal for users with autism, cerebral palsy, Down syndrome and intellectual disabilities.

Also included are environmental controls (ECU), social media, email and music, as well as access to thousands of Windows applications.

“We want to deliver a complete solution that is super easy to start using and that grows and adapts with the needs of symbol based communicators,” Tobii Dynavox says. “Together with the full ecosystem of support like Pathways for Core First, we can now offer an unmatched program to enable verbally limited individuals to gain literacy and life changing independence.”

The Indi is available now together with a selection of accessories, such as a carrying handle and protective case.
