Samsung reveals a couple of additions to the Galaxy Note phablet family at IFA 2014, the Note 4 and Note Edge, as well as a smartphone-powered collaboration with VR headset maker Oculus, the Gear VR.

Described by Samsung CEO JK Shin as "the most Note experience to date," the Galaxy Note 4 features a 5.7-inch Super AMOLED display handling 2560 x 1440 resolution inside faux-leather soft-touch plastic casing. The company sells the massive display as being ideal for multitasking, as its Multi Window feature allows users view apps in full, split or pop-up screen modes.

Making touchscreen a bit more easier to navigate is an updated version of the S Pen stylus, now with double the pressure sensitivity allowing for two pen styles-- calligraphy pen or fountain pen. It also features enhanced Air Command functionality and a Snap Note feature for users wanting to attach photos or voice memos to the S Note app.

More interesting Note 4 features include Fast Charging (Samsung claims the 3220mAh battery charges to 50% in all of 30 minutes), 3 microphones, 16MP rear-facing camera with optical image stabilization and a front-facing 3.7MP camera with f1.9 aperture one can activate with the heart rate monitor on the back of the device.

Also revealed at IFA 2014 is the Note Edge-- essentially a Note 4 with a display curving over the the right-hand edge of the device. This extra bit of screen real estate provides shortcuts to apps and alerts when the cover is closed, and notifications or in-app controls when viewing a video or taking a photo.
