

Samsung Monitors Also Get Curved

Written by Bob Snyder
02 October 2014

Samsung puts the technology from its curved TV range to PC display use with the SD590C, a 27-inch curved LED monitor the company describes as "architected as the ultimate entertainment display."

Promising to be "completely immersive," the SD590C features a narrow bezel and built-in dual-channel 5W speakers, as well as a "carefully selected" curvature providing a supposedly wider field of view than traditional flat 27-inch panels.

Technical features include up to 350 nit brightness and 3000:1 dynamic contrast ratio. A Game Mode provides automated settings during play, enhancing colours, brightness and contrast according to what is on screen.

Users can also connect 2 or 3 SD590C monitors to create a huge display with a wider, gentler curve.

The SD590C is available in the US from October 2014. No word on availability in European markets as yet, but we assume it will happen soon enough.
