Eizo announces what it describes as the world's first glasses-free 3D desktop monitor, the Duravision FDF2301-3D.

The 23" display handles 1920 x 1080 resolution and aims at the industrial market.

Eizo's directional backlight technology produces the 3D effect as it displays 2 different images (combined to form the 3D picture) in a time lag.

The manufacturer says the monitor should display stable HD 3D images viewable from all angles.

It should be available by Q2 2010.
