LG releases 2 Cinema 3D monitors-- D41P and D42P-- carrying LG's Film Patterned Retarder (FPR) technology that should provide more comfortable and flicker-free 3D imagery.

The company says the monitors carry "flicker-free" certification awarded by TÜV and Intertek, as well as provide brighter 3D image and lower crosstalk. Being passive 3D, the glasses users wear are lightweight and need no recharging.

The monitors should work with all graphics cards and support HDMI 1.4, while also having a 2D to 3D conversion function.
