Philips announces the 349X7FJEW-- a 34-inch curved monitor featuring an UltraWide QHD VA panel with 3440 x 1440 resolution, 1800R screen curvature and wide colour gamut support.

The monitor has a design complete with an edge-to-edge display and subtle curves on the chrome and glass stand. The stand offers height and tilt adjustment, and users can replace it with a VESA mount. A LowBlue mode reduces eye fatigue, while AMD FreeSync support reduces stuttering, tearing or motion blur when paired with a compatible graphics card.

MultiView connectivity allows dual inputs to share display real estate, and can be used in either PIP or PBP modes. On the port side the monitor has HDMI and DisplayPort connections, as well as a 3-way USB 3.0 splitter. A final inclusion is built-in 5W speakers.

The 349X7FJEW Monitor is available from April 2017.
