

Control4 Goes for Wireless Audio

Written by Marco Attard
30 January 2013

Automation vendor Control4 makes an audio debut at ISE 2013-- the Wireless Music Bridge, a device allowing customers to wirelessly connect and stream music on PCs or mobile devices on Control4 systems.

With Bluetooth, DLNA, Airplay, wifi and ethernet support, the Wireless Music Bridge streams audio from most, if not all, devices. It supports full metadata (including cover art) and allows access to connected content and devices through all Control4 interfaces, including TVs.

In addition, Control4 systems with OS 2.4 get a TuneIn update, allowing access to over 700000 traditional and internet radio stations, as well as on-demand audio and podcasts.

The Control4 Wireless Music Bridge ships from Q2 2013, while the TuneIn update should roll out from April 2013.
