

A Litl Settop Box

Written by Marco Attard
01 December 2010

Litl plans to take on Google and Apple's TV offerings with its internet-TV settop box

With a planned early 2011 launch, it carries the same Linux-based OS as litl's Webbook (a device whose key feature is literally bending backwards).

The OS supports Adobe Flash 10.1, and its SDK was released at this year's Flash and the City developers' conference.

Few details are out-- the box comes with a touchscreen remote allowing multitouch gesture control. It has HDMI and composite-out connections as well as ethernet/wifi options.
