09 March 2017

Cooler Master launches the MasterWatt Maker 1200-- a 1200W PSU co-developed with Japanese manufacturer Murata in celebration of the company's 25th anniversary.

First revealed back at CES 2017, the MasterWatt Maker 1200 is made in Japan using a combination of Japanese and German components. It claims over 80 Plus Titanium efficiency and features a 135mm Silencio FP fan that only starts spinning once the supply hits 50% load.

It also carries fully-modular cables armed with a new kind of flat connector offering improved surface contact and a stacked transformer able to provide independent power conversion for the 5V and 3.3V rails. The PSU is larger than most units of its kind-- it is 224mm long, making it best suited for full-tower chassis armed with 3-4 graphics cards, a dozen HDDs and other components.

The MasterWatt Maker 1200 is available now.
