Taiwanese accessory maker Reeven announces the NAIA 240-- an AIO liquid cooler promising "efficient cooling, simple maintenance and intuitive design" in an all-in-one cooling solution.

First seen back at Computex 2017, the NAIA 240 features a WAP (Water Above Pipe) design to allow installation in any orientation without loss in pumping power. The curved baseplates feature micro channels at just 0.11mm to provide efficient heat transfer, while a pair of 120mm "Coldwing" fans deliver high airflow at 25dBA.

For customers with a penchant for PC customisation the coolant reservoir section on top of the pump block is transparent. An opening in the factory-sealed tank allows the injection of dye in the coolant, and the package includes 3 bottles of CMY dyes for the creation of different colours. A white LED lights up the dye-infused coolant to complete the effect.

The NAIA 240 is available now.
