

Corsair Upgrades One SFF PC

Written by Frederick Douglas
22 February 2018

Corsair upgrades the "category defying" One small form factor (SFF) gaming PC range through the addition of 8th generation Intel CPUs, as well as GTX 1080 Ti graphics and m.2 NVMe flash storage.

[First announced back in February 2017](#) , the One is the first pre-configured and branded PC from Corsair. It has a design sitting somewhere between a regular desktop PC and the Apple Mac Pro cylinder, with a compact (12l) chassis fitting a silent liquid cooling system as well as all the guts required for a higher-end gaming machine.

The updates come in two flavours-- Pro Plus and Elite. Both feature the same 8th generation 6-core Intel Core i7-8700K CPU, Nvidia GTX 1080 Ti graphics card and storage via 480GB SSD and 2TB HDD. The main difference boils down to RAM, since the Pro Plus carries 16GB while the Elite has 32GB.

The One Pro Plus and Elite are available now. Also still available are the original One models, with 7th generation Intel Core i7-7700K CPUs and GTX 1080 graphics.
