Gigabyte prepares for the launch of the Aorus RTX 20 Xtreme graphics card series, with social media teasing various SKUs based on the latest Nvidia GPUs, namely the RTX 2080, RTX 2080 Ti and RTX 2070.

So far the company has a product page for one card-- the RTX 2080-based Aorus GeForce RTX 2080 Xtreme 8G. It features an integrated 8GB GDDR6 256-bit memory interface, together with a Windforce Stack cooling system with three 100mm fans and "reinvented" RGB lighting with colourful fan edges and RGB Fusion sync.

The card offers no less than x7 video outputs, with x3 DisplayPort 1.4, x3 HDMI 2.0b and x1 USB-C with VirtualLink support. It is also built for "extreme" overclocking, with 12+2 power phases, while the metal backplate is complete with an illuminated Aorus logo.

Aorus does not provide further details on the cards (such as GPU/memory clocks), but does say they should be available soon.
