Taiwanese PC accessory maker FSP launches a unique-looking PC case able to carry two PCs-- the T-Wings (CMT710), a semi-open chassis complete with an angular winged design the company says is inspired by bat wings.

First seen back at CES 2020, the T-Wings is primarily aimed at "hardcore gamers," as well as high-end desktop systems. As such, it is fully RGB LED-lit and offers liquid cooling support with up to two 360mm radiators. Construction is in aluminium with 4mm tempered glass panels, and customers have to keep in mind the wings are fixed, not animated.

The chassis is divided in two chambers, each able to house a complete PC system. The larger chamber holds up to EATX motherboards, while the other supports mini-ITX motherboards. A central 40mm chamber allows for easy cable management, and as well as the aforementioned radiators the T-Wings can fit up to three 120mm intake fans in each side. The built-in RGB lighting is compatible with most motherboard sync systems, and the front I/O panel includes a USB-C port.
