Android Tablet Security via Kaspersky

Written by Marco Attard

Kaspersky launches an Android tablet protection security-- Kaspersky Tablet Security, providing protection against malicious and fraudulent software and a solution in case of lost or stolen devices.

The anti-virus engine works with cloud-based protection technology, which Kaspersky claims blocks all (including new and previously unknown) malicious programs. A Web Protection feature also blocks fraudulent websites from accessing personal data on your customers' devices.

Tablet Security can also block lost or stolen devices, as well as wipe all personal data. It also locates devices through GPS, mobile network data (GSM) or the coordinates of the nearest wifi access points, while a Mugshot function secretly takes photos (using built-in camera) of whoever is using a stolen device.

Kaspersky says the program's UI is specifically suited for Android-based tablets, and a web management feature allows users to remotely access and control tablets via web interface.
