

A Robot to Clean your... Mobile Displays

Written by Marco Attard
06 February 2013

Customers complaining about all the man hours they waste cleaning smartphones and tablets? No more-- Japan's Takara Tomy has an adorable mechanised solution with the "AutoMee S."

Looking like a palm-sized Roomba robot, the AutoMee S trundles on 5 tires (3 for maneuvers, 2 for cleaning) over devices, with sensors making sure the little robot does not fall off the edges while performing its duties.

Takara Tomy says the robot takes 4 minutes to clean a smartphone and 8 minutes for a tablet, and it even makes a "cute" sound once finished. Too bad the company denies responsibilities for potential damages to devices or their software...

The AutoMee S will be available in Japan from March 2013, with no mention of an international launch. No lie, we kind of want one.
