

## A Mini Heater to Heat PC User Hands

Written by Marco Attard

---

"No more cold hands," the Kickstarter for the Heatbuff promises-- and just as well, since the crowdfunded device in question is a small heater designed to warm the hands of keyboard and mouse users.

The Heatbuff uses infrared as a "no-burn technology" in order to keep fingers toasty, all while not melting keyboards or mice down. The actual device is around 38cm wide, and features twin heaters one can adjust and angle from the centre to customise the amount of heat provided.

According to the maker, Danish startup Envavo, warm hands lead to increased gaming or typing performance. Or, as the pitch video puts it, "Even if you sit in a chilly environment, your hands will remain warm. Type faster and more accurately. Play better and hit your targets. And feel more comfortable doing it."

As mentioned earlier the Heatbuff is currently available in preorder form on Kickstarter. Shipments are estimated to start on December 2017.
